By Jake Hines

AutoKey_Keymix

Keyframe a Keymix to a single frame or a frame range in one click.

Why I made it

If you have ever got tired of setting up a Keymix, going to the frame or range you want, keying it there, then stepping before and after to set it back to 0, this node does it for you. I made it because I kept hitting the same problem, and I have used it ever since, so I thought I would share it.

At a glance

Single frame

Set to the frame you are on as soon as you place it. Zero either side.

Frame range

Tick one checkbox and type in the first and last frame.

Fade

Optionally fade off from the range by choosing the frames that sit at 0.

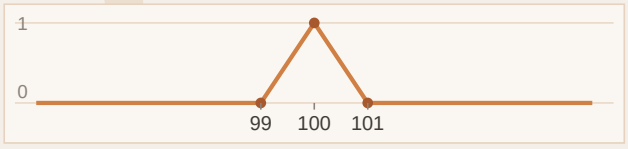
How to use it

1. Place the node. It is set to the frame you are on straight away.
2. To use it for a single frame somewhere else, go to that frame and click **Set to current frame**. That keys the one frame and sets it to 0 either side.
3. For a frame range, tick **Frame Range** and enter the frames in the two boxes that unlock.
4. To fade off from that range, tick **Fade** and pick the frames you want to be the 0 value.

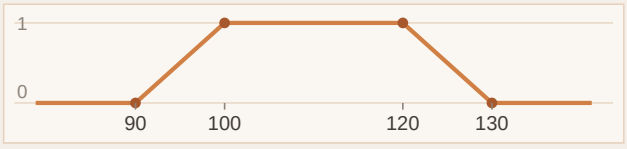
Controls

Control	What it does
Set to current frame	Keyframes the mix on the frame you are on, with 0 on either side.
Frame Range	Checkbox. Unlocks the two frame boxes for the first and last frame.
Fade	Checkbox. Fades off from the range. Select the frames you want at 0.

What the keys look like (illustrations with example frame numbers)



Single frame, 0 either side



Frame range with a fade

Getting the node

It is on GitHub: github.com/Jake-Hines/Gizmos/tree/main/AutoKey_Keymix

A note and further help

I am by no means a pro at Python, and I would not call myself a guru. This was the first node I made, with AI helping on the code, so take it as a practical tool rather than polished software.

If you would like any more help with it, message me on LinkedIn. I am not that popular, so I will most likely see it and respond.
